FireSim

A Brief Tour of FireSim: The Manager & Compiler; Building Hardware Designs

https://fires.im

Speaker: Sagar Karandikar

Agenda: What Will We Cover?

- 1) The Compiler \rightarrow Golden Gate
- Invoke it on example RTL
- Inspect its outputs

- 2) The Manager → firesim
- Explain how it's configured
- Demonstrate how it's used to build bitstreams

Where is FireSim in Chipyard?

With the software RTL simulators! ~/chipyard-afternoon/sims/firesim

→ This has been exported as \$FDIR

<ssh back onto your ec2 instance>

\$ tmux new -s afternoon

\$ cd \$FDIR

\$ ls

FireSim's Directory Structure

sim/

- Golden Gate lives here
- Scala & C++ sources for additional FireSim models
- Make-based build system to invoke Golden Gate

deploy/

- Manager lives here
- FireSim workload definitions

platforms/ → FPGA platform definitions (e.g. AWS FPGA for F1, Xilinx Vitis for U250)

 $sw/ \rightarrow target software \& FireMarshal (more on this later)$

Agenda: What Will We Cover?

- 1) The Compiler \rightarrow "Golden Gate"
- Invoke it on example RTL
- Inspect its outputs

- 2) The Manager → firesim
- Explain how it's configured
- Demonstrate how it's used to build bitstreams

- \$ cd \$FDIR/sim
- \$ make DESIGN=FireSim

An Analogy

Golden Gate is like Verilator but for FPGA-accelerated simulation

Verilator generates C++ sources to simulate your design.

 \rightarrow Compile and run on a CPU-host

Golden Gate generates C++ <u>& Verilog</u> to simulate your design.

 \rightarrow Compile and run on a hybrid CPU & FPGA host

Golden Gate Compiler

Inputs:

- FIRRTL & annos from a Chipyard generator
- Compiler configuration
- \rightarrow Produces sources for a simulator that are:
- deterministic
- support co-simulation of software models
- area-optimized to fit more on the FPGA

Interacting with Golden Gate via Make

• Make invokes Golden Gate with three variables (the "Tuple"):

DESIGN:

• The top level module \rightarrow MODEL in Chipyard

TARGET_CONFIG:

• The generator's config \rightarrow CONFIG in Chipyard

PLATFORM_CONFIG:

• Compiler options passed to Golden Gate

- \$ cd \$FDIR/sim/generated-src/f1
- # here you'll find output directories for all builds
- \$ cd <any-directory-here>
- \$ ls

Inspecting the Outputs

<long-name>.fir & <long-name>.anno.json

• Target's FIRRTL & annotations

FireSim-generated.sv

• The compiled simulator

FireSim-generated.const.h

• Simulator's memory map

FireSim-generated.runtime.conf

• A default runtime configuration for simulation

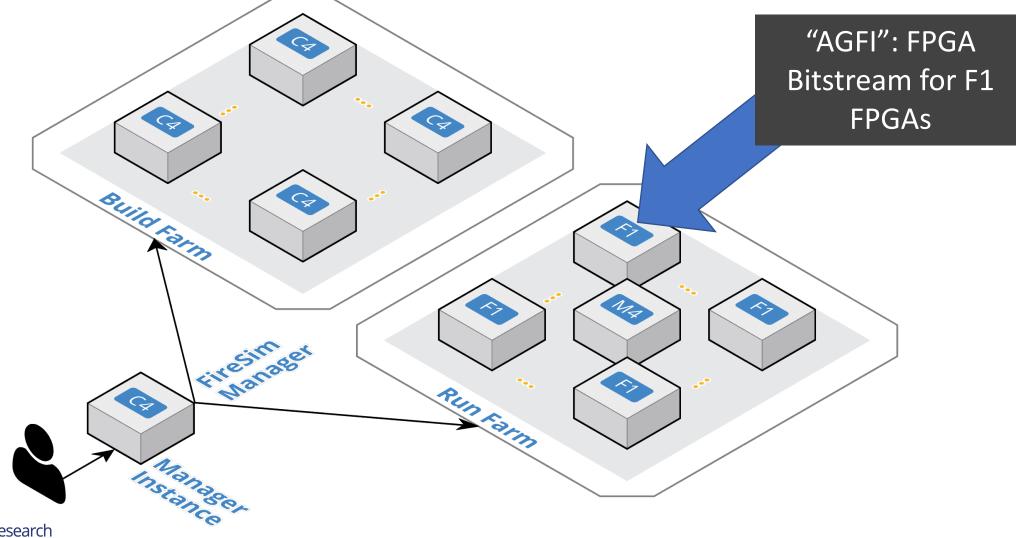

Agenda: What Will We Cover?

- 1) The Compiler \rightarrow Golden Gate
- Invoke it on example RTL
- Inspect its outputs

- 2) The Manager → firesim
- Explain how it's configured
- Demonstrate how it's used to build bitstreams

6

Background Terminology

Using the firesim Manager Command Line

- Sourcing sourceme-fl-manager.sh puts firesim on your path
- Can call firesim from anywhere on the instance
- It will always run from the directory:

\$FDIR/deploy/

\$ cd \$FDIR/deploy

\$ firesim managerinit --platform f1

\$ ls

Configuring the Manager. 4 files in firesim/deploy/

config build.yaml

share_with_accounts:

To share with a specific user: somebodysname: 123456789012

To share publicly: #public: public

Once you're done with builds:

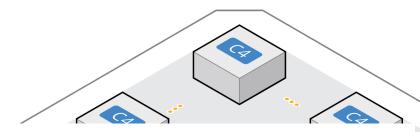

• A list of recipes you'd like to share with other users

Running builds

- Once we've configured *what* we want to build, let's build it
- \$ firesim buildbitstream
- This completely automates the process. For each design, in-parallel:
 - Launch a build instance (c5.4xlarge)
 - Generate target RTL & invokes Golden Gate
 - Ship infrastructure to build instances, run Vivado FPGA builds in parallel
 - Collect results back onto manager instance
 - \$FDIR/deploy/results-build/<TIMESTAMP>-<tuple>/
 - Email you the entry to put into config_hwdb.yaml
 - Terminate the build instance

AWS Notifications <no-reply@sns.amazonaws.com> to me ▼

Your AGFI has been created! Add

firesim_rocket_singlecore_no_nic_l2_lbp: agfi: agfi-0e27eb94672e2f5a9 deploy_triplet_override: null custom_runtime_config: null

to your config_hwdb.yaml to use this hardware configuration.

- \$ cd \$FDIR/deploy
- # Pretend we built an FPGA image earlier
 # There's info for a completed build here!:
- \$ cat built-hwdb-entries/*

Anatomy of a HWDB Entry

firesim_rocket_quadcore_nic_l2_llc4mb_ddr3:
 agfi: agfi-0c45d995a46cce5dc
 deploy_triplet_override: null
 custom_runtime_config: null

- Same label as before
- The FPGA image

Hooks to change:

- Software models
- Runtime arguments

→ Without FPGA recompilation

Summary

- Don't fret if you didn't catch everything, everything we showed you today is documented in detail at <u>https://docs.fires.im</u>
- We learned how to:
 - Build FireSim FPGA images for a set of targets
 - https://docs.fires.im/en/stable/Building-a-FireSim-AFI.html
